

KB QUEENS

An AI Knowledge-Base (KB) Generator for INVEST and Salesforce Support

Opportunity

- Support teams sit on a goldmine of failure data. Jira stories, linked bugs, QA defects, and metadata that already predicts most of what will go wrong for users.
- Today, turning that data into usable KB articles is slow, manual, and inconsistent.
- An AI-assisted KB generator can mine that evidence automatically and draft content in a consistent format in minutes instead of hours. SMEs can spend their time reviewing instead of writing from scratch. This will reduce time-to-resolution without sacrificing accuracy.

High ticket volume. Little repeat content. No time to dig.

1

Slow

Writing KB articles by hand from Jira stories and QA defects takes hours per feature.

2

Risky

A poorly written or incomplete KB doesn't just fail to help; it can actively mislead team members, cause churn, and waste time.

3

Uneven

Article quality depends entirely on who wrote it and how much time they had.

4

Discoverability

Can be challenging to locate the correct KB.

Feed it the evidence. It drafts the runbook.

1

Inputs

Jira stories, linked bugs/QA defects, Salesforce metadata extract

2

Mine defects

Real, already-occurred failures become high confidence articles

3

Walk the taxonomy

14 failure categories — draft an article or rule it out, never skip silently

4

Cite or don't write it

Every step traces to a Jira key or metadata component. No invented UI.

Draft only. Every output goes to SME review before it reaches an agent.
